Two moons: vote-model comparison at K=10

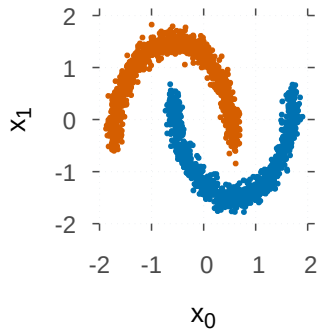

reference labels

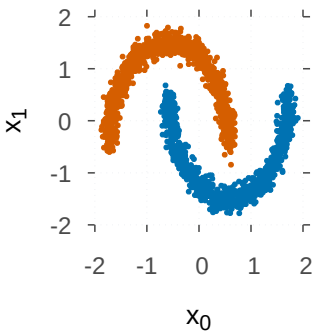

budget-matched uniform
h(u)=1
C=2; ARI=1; NMI=1

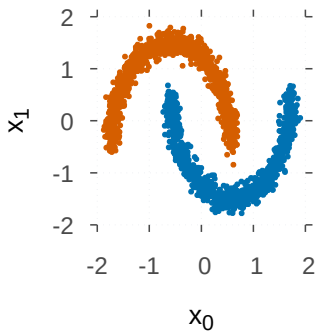

budget-matched inverse
h(u)=1/u
C=2; ARI=1; NMI=1

reference inverse-square
$g(r)=1/r^2$
C=2; ARI=1; NMI=1

budget-matched sigmoid
$h(u)=S_\alpha(u)$, α=8
C=2; ARI=1; NMI=1

Four budget-matched shapes; inverse-square is the reference.

Colours identify clusters independently in each panel.

Grey denotes an unclustered point.

Every model uses the same KNN graph and source vote budget.
