swiss_roll: RTKNNC vote-model comparison at K=4

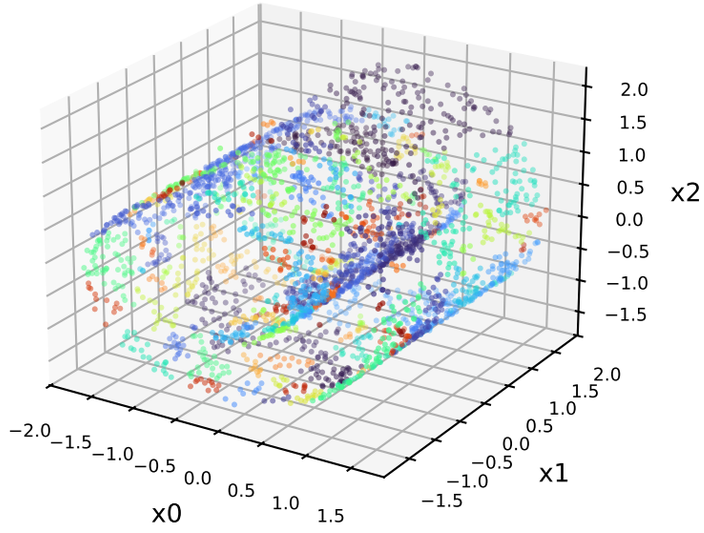

reference labels

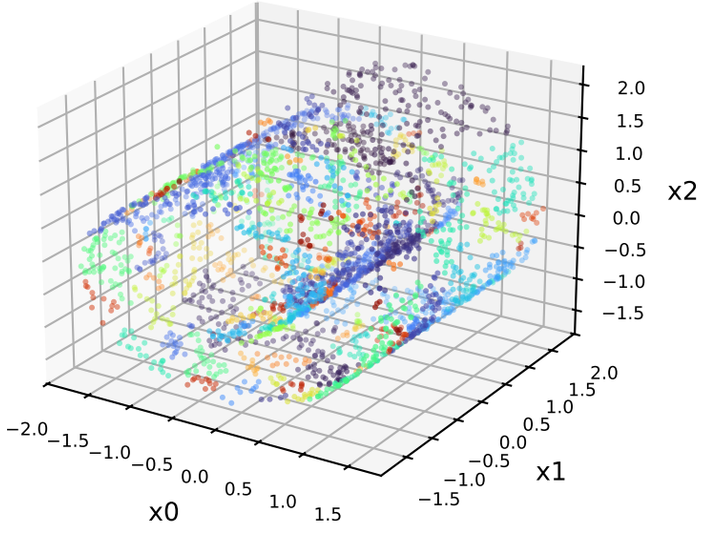

uniform $g(r) = 1$
clusters=161, ARI=0.152, NMI=0.513

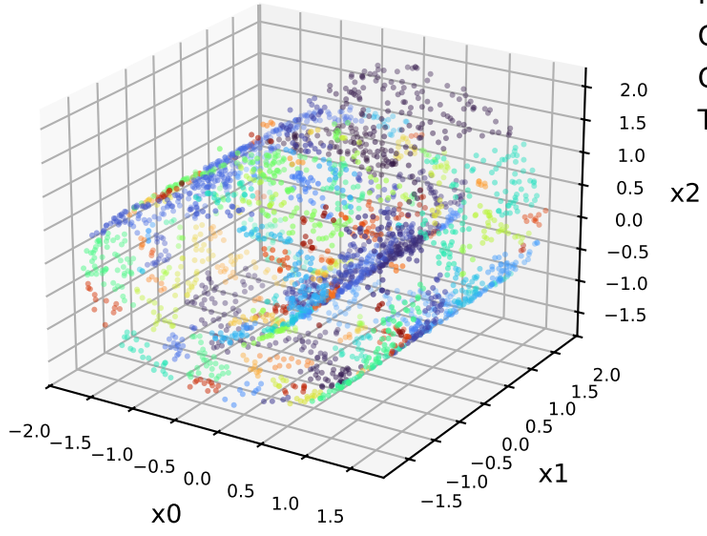

inverse $g(r) = 1/r$
clusters=161, ARI=0.152, NMI=0.513

inverse-square $g(r) = 1/r^2$
clusters=156, ARI=0.153, NMI=0.513

sigmoid $S_{\alpha,R}(r)$, $\alpha = 8$
clusters=161, ARI=0.152, NMI=0.513

Four kernels: uniform, inverse, inverse-square, and local sigmoid.
Colours identify predicted clusters independently in each panel.
Grey denotes an unclustered point.
The same directed KNN graph is reused by every vote model.
